Lee DixonIt is always a pleasure to read a well written book in a leading edge arena and that's exactly what this book provides. With the

potential for myself to be involved with Test and Evaluation (TE) in Enterprise Resource Planning (ERP) I was looking for a book that captured the latest thinking for Enterprise Architecture (EA) and had the vision of what the future held in this fast paced area of business. Chorafas, one of the most prolific writers and orchestrators of future thought, provides numerous real world examples to document the complex integration problems and a response to evolutionary trends. Being on Temporary Duty (TDY) in the Austin, TX area it was somewhat serendipity to see a front page story in the local newspaper about Dell Computers vision of the future. Dell uses EA extensively. Any senior decision-maker in private industry or government that's not familiar with most of the concepts captured in this book is doing a disservice to himself and the organization he/she leads. Nanotechnology, optics, and biological frontiers are all covered with the latest information and then linked to the most advanced applications, tools and methods available to maximize return on investment (ROI) for as Chorafas notes several times..."cost matters". One of the highlights is the numerous graphs and models to capture complex thoughts with relative simplicity.

Based on an extensive research project done by the author in the United States, Britain, Germany, France, Switzerland, Sweden, and Austria from December 1999 to June 2001, Enterprise Architecture and New Generation Information Systems focuses on four main themes: Next Generation Information Technology, The Likely Technologies of this Decade, Enterprise Computing, and The Internet as the 21st Century's Answer to Merchandising. While the majority of books presently available on information systems are written from the viewpoint of system analysis, programming, or common applications, this text: Brings to the reader's attention the importance of organization and infrastructure, Presents a wealth of case studies to explain the need for reengineering and restructuring, Details the latest advances which influence the implementation of advanced technology. Written in a simple, comprehensive manner without specific prerequisites and data processing jargon, with concepts and case studies properly explained, this book addresses itself to practitioners in computer technology, telecommunications and software development, who are interested in acquiring skills through knowledge of the most advanced applications, tools, and methods, both present and coming. Enterprise Architecture and New Generation Information Systems will prove appealing to every person charged with planning, developing, applying, and delivering advanced information systems, architectural solutions, and programming products.
